

Description:

Puredine is a web application that allows users search restaurants around the world and check their menus for different allergy saftey guidelines.

The website features a general searchbar that can search for a restaurant based on name, zipcode, or city and lists different statistics and reviews provided by the Google Places API.

Once selected, a menu will display different foods from the establishment and, with checkboxes marking the 8 main allergy types given by the FALCPA, can be highlighted if the food is safe to eat or dangerous based on selections helped with the Edamam API. These selections can be done either with or without a login to save information.

This project has the main objective of providing a resource to those suffering with different allergies a way to find health information for any establishment they dine at.
